

RAFTER BRACKET

Rafter Bracket

A unique feature of all Interline Rafter Brackets allows Interline metal fascia to act as a structural fascia during roof construction.

The patented soffit groove engagement of Interline metal fascia prevents the rafter bracket from disengaging from the fascia during laying of tile roofs.

Without this unique feature the structural integrity of the metal fascia could be compromised.

UNIQUE PATENTED SOFFIT GROOVE ENGAGEMENT

Soffit groove engagement also overcomes many problems of denting and damage in metal fascia due to differential movement of trusses and rafters when loaded with roof tiles.
